# An asymmetric multiparameter CCR flow

S. Sundar

January 3, 2020

#### Abstract

In this note, we exhibit an example of a multiparameter CCR flow which is not cocycle conjugate to its opposite. This is in sharp contrast to the one parameter situation.

AMS Classification No.: Primary 46L55; Secondary 46L99. Keywords : Decomposable product systems, opposite of a CCR flow.

## 1 Opposite of an  $E_0$ -semigroup

Let  $P \subset \mathbb{R}^d$  be a closed convex cone. We assume that  $d \geq 2$ , P spans  $\mathbb{R}^d$  and P contains no line, i.e.  $P \cap -P = \{0\}$ . We denote the interior of P by  $\Omega$ . For  $x, y \in \mathbb{R}^d$ , we write  $x \leq y$   $(x < y)$  if  $y - x \in P$   $(y - x \in \Omega)$ . Let  $\alpha := {\alpha_x}_{x \in P}$  be an  $E_0$ -semigroup over P on  $B(\mathcal{H})$  where  $\mathcal H$  is an infinite dimensional separable Hilbert space. For  $x \in P$ , let

$$
E(x) := \{ T \in B(\mathcal{H}) : \alpha_x(A)T = TA \text{ for all } A \in B(\mathcal{H}) \}.
$$

For  $x \in P$ ,  $E(x)$  is a separable Hilbert space where the inner product is given by  $\langle T|S \rangle = S^*T$ . The disjoint union of Hilbert spaces  $\mathcal{E} := \prod E(x)$  has a structure of x∈Ω a product system and is called the product system associated with  $\alpha$ . It is indeed a cocycle conjugacy invariant. For more on product systems and  $E_0$ -semigroups in the multiparameter context, we refer the reader to [\[5\]](#page-9-0).

Keep the foregoing notation. Let

$$
\mathcal{E}^{op} := \{ (x, T) \in \Omega \times B(\mathcal{H}) : x \in \Omega, T \in E(x) \}.
$$

Define a semigroup multiplication on  $\mathcal{E}^{op}$  by the following formula:

<span id="page-0-0"></span>
$$
(x, T) . (y, S) = (x + y, ST)
$$
\n(1.1)

for  $(x, T), (y, S) \in \mathcal{E}^{op}$ . Then  $\mathcal{E}^{op}$  is an abstract product system over  $\Omega$  (in the sense of Definition 2.1 of [\[5\]](#page-9-0)). Arveson's bijection between product systems and  $E_0$ -semigroups, established in [\[5\]](#page-9-0) for the case of a cone, ensures that there exists an  $E_0$ -semigroup denoted  $\alpha^{op} := {\alpha_x^{op}}_{x \in P}$ , which is unique up to cocycle conjugacy, such that the product system associated to  $\alpha^{op}$  is isomorphic to  $\mathcal{E}^{op}$ . The  $E_0$ -semigroup  $\alpha^{op}$  is called the opposite of  $\alpha$ .

A natural question that arises in this context is the following. Are the  $E_0$ -semigroups α and  $\alpha^{op}$  cocycle conjugate ? If α is cocycle conjugate to  $\alpha^{op}$ , we call α symmetric otherwise we call  $\alpha$  asymmetric. In the one parameter context, we have the following.

- (1) One parameter CCR flows are symmetric. This follows from Arveson's classification of type I  $E_0$ -semigroups and the index computation.
- (2) Tsirelson in his remarkable papers [\[8\]](#page-9-1) and [\[9\]](#page-9-2) constructed examples of type  $II_0$  $E_0$ -semigroups which are asymmetric by probabilistic means.

It is natural to ask whether (1) stays true in the multiparameter context. More precisely, suppose  $d \geq 2$  and V is a pure isometric representation of P on a Hilbert space H. Let  $\alpha^V$  be the CCR flow associated to V acting on  $B(\Gamma(\mathcal{H}))$  where  $\Gamma(\mathcal{H})$  is the symmetric Fock space of H. Is  $\alpha^V$  symmetric ? We show that for the left regular representation of P on  $L^2(P)$ , the associated CCR flow is asymmetric.

#### 2 Decomposable product systems

Following Arveson, the author in [\[7\]](#page-9-3) has defined the notion of a decomposable product system. Let us review the definitions. Let  $\alpha := {\{\alpha_x\}}_{x \in P}$  be an  $E_0$ -semigroup on  $B(\mathcal{H})$ and let  $E := \{E(x)\}_{x \in P}$  be the associated product system. Suppose  $x \in P$  and  $u \in E(x)$ is a non-zero vector. We say that u is decomposable if given  $y \leq x$  with  $y \in P$ , there exists  $v \in E(y)$  and  $w \in E(x - y)$  such that  $u = vw$ . The set of decomposable vectors is denoted by  $D(x)$ . We say that  $\alpha$  is decomposable if

- (1) for  $x, y \in P$ ,  $D(x)D(y) = D(x + y)$ , and
- <span id="page-1-0"></span>(2) for  $x \in P$ ,  $D(x)$  is total in  $E(x)$ .

**Proposition 2.1** *The opposite of a decomposable E*<sub>0</sub>-semigroup is decomposable.

Remark 2.2 *The subtle point that we wish to stress is that apriori the product rule in the opposite product system given by Eq. [1.1](#page-0-0) holds only over* Ω*. However to prove Prop. [2.1,](#page-1-0) we need the validity of the product rule over the whole semigroup* P *which is assured by the next lemma.*

Let us fix a few notation. Let  $\alpha := {\{\alpha_x\}}_{x \in P}$  be a decomposable  $E_0$ -semigroup acting on  $B(\mathcal{H})$ . The product system of  $\alpha$  is denoted by  $E := \{E(x)\}_{x \in P}$ . We denote the opposite of  $\alpha$  by  $\beta := {\beta_x}_{x \in P}$ . Suppose that  $\beta$  acts on  $B(\tilde{\mathcal{H}})$ . Denote the product system of  $\beta$  by  $F := \{F(x)\}_{x \in P}$ .

<span id="page-2-1"></span>**Lemma 2.3** For every  $x \in P$ , there exists a unitary  $\theta_x : E(x) \to F(x)$  such that for  $x, y \in P$ ,  $T \in E(x)$  and  $S \in E(y)$ ,

$$
\widetilde{\theta}_{x+y}(ST) = \widetilde{\theta}_x(T)\widetilde{\theta}_y(S).
$$

*Proof.* From the definition of  $\beta$ , it follows that for  $x \in \Omega$ , there exists a unitary operator  $\theta_x : E(x) \to F(x)$  such that for  $x, y \in \Omega, T \in E(x)$  and  $S \in E(y)$ ,

$$
\theta_{x+y}(ST) = \theta_x(T)\theta_y(S).
$$

Fix an element  $a \in \Omega$ . Let  $x \in P$  and  $T \in E(x)$  be given. We claim that there exists a unique bounded linear operator on  $H$ , which we denote by  $\theta_x(T)$ , such that for  $S \in E(a)$ and  $\xi \in \mathcal{H}$ ,

$$
\tilde{\theta}_x(T)\theta_a(S)\xi = \theta_{a+x}(ST)\xi.
$$

For any  $b \in \Omega$ , the map  $E(b) \otimes \widetilde{H} \ni S \otimes \xi \to \theta_b(S)\xi \in \widetilde{\mathcal{H}}$  is a unitary operator. This way, we can identify  $\widetilde{\mathcal{H}}$  with  $E(b) \otimes \widetilde{\mathcal{H}}$  for every  $b \in \Omega$ . Right multiplication by T induces a bounded linear operator from  $E(a) \to E(a+x)$  of norm ||T||. Tensor with identity to obtain the desired operator  $\widetilde{\theta}_x(T)$  from  $\widetilde{\mathcal{H}} \equiv E(a) \otimes \widetilde{\mathcal{H}} \to E(a + x) \otimes \widetilde{\mathcal{H}} \equiv \widetilde{\mathcal{H}}$ . This proves our claim.

As the set  $\{\theta_a(S)\xi : S \in E(a), \xi \in \tilde{\mathcal{H}}\}$  is total in  $\tilde{\mathcal{H}}$  and  $\{\theta_x\}_{x \in \Omega}$  is anti multiplicative, it follows that  $\theta_x = \theta_x$  if  $x \in \Omega$ . Let  $x \in P$ ,  $y \in \Omega$ ,  $T \in E(x)$  and  $S \in E(y)$  be given. For  $R \in E(a)$  and  $\xi \in \widetilde{\mathcal{H}}$ , calculate as follows to observe that

$$
\widetilde{\theta}_{x+y}(TS)\theta_a(R)\xi = \theta_{(a+x)+y}(RTS)\xi
$$

$$
= \theta_y(S)\theta_{a+x}(RT)\xi
$$

$$
= \theta_y(S)\widetilde{\theta}_x(T)\theta_a(R)\xi.
$$

Hence it follows that

<span id="page-2-0"></span>
$$
\widetilde{\theta}_{x+y}(TS) = \theta_y(S)\widetilde{\theta}_x(T) \tag{2.2}
$$

for  $x \in P$ ,  $y \in \Omega$ ,  $T \in E(x)$  and  $S \in E(y)$ .

Let  $x, y \in P$ ,  $T \in E(x)$  and  $S \in E(y)$  be given. Let  $R \in E(a)$  be of unit norm. Calculate as follows to observe that

$$
\theta_a(R)\theta_{x+y}(TS) = \theta_{x+y+a}(TSR) \text{ (by Eq. 2.2)}
$$

$$
= \theta_{x+(y+a)}(T(SR))
$$

$$
= \theta_{y+a}(SR)\tilde{\theta}_x(T) \text{ (by Eq. 2.2)}
$$

$$
= \theta_a(R)\tilde{\theta}_y(S)\tilde{\theta}_x(T) \text{ (by Eq. 2.2)}.
$$

Premultiplying the above equation by  $\theta_a(R)^*$ , we get

<span id="page-3-1"></span>
$$
\widetilde{\theta}_{x+y}(TS) = \widetilde{\theta}_y(S)\widetilde{\theta}_x(T) \tag{2.3}
$$

for  $x, y \in P$ ,  $T \in E(x)$  and  $S \in E(y)$ .

Note that for  $x \in P$ , the map  $E(x) \ni T \to \tilde{\theta}_x(T) \in B(\tilde{\mathcal{H}})$  is linear and norm preserving. A direct calculation reveals that for  $x \in P$ ,  $T_1, T_2 \in E(x)$ ,

<span id="page-3-0"></span>
$$
\widetilde{\theta}_x(T_2)^*\widetilde{\theta}_x(T_1) = \langle T_1 | T_2 \rangle_{E(x)}.
$$
\n(2.4)

For  $x \in P$ , let  $F(x) := \{\theta_x(T) : T \in E(x)\}$ . Fix  $x \in P$ . It follows from Eq. [2.4](#page-3-0) that there exists a unique normal  $*$ -endomorphism denoted  $\tilde{\beta}_x$  on  $B(\tilde{\mathcal{H}})$  such that the intertwining space of  $\beta_x$  is  $F(x)$ . Eq. [2.3](#page-3-1) implies that the family  $\beta := {\beta_x}_{x \in P}$  forms a semigroup of endomorphisms.

Note that  $F(x) = F(x)$  for every  $x \in \Omega$ . Hence  $\beta_x = \beta_x$  for  $x \in \Omega$ . The semigroup  $\beta$ agrees with an  $E_0$ -semigroup β on the interior  $Ω$ . Thanks to Lemma 4.1 of [\[6\]](#page-9-4), it follows that  $\beta$  is an  $E_0$ -semigroup. Since  $\Omega$  is dense in P, it follows that  $\beta_x = \beta_x$  for every  $x \in P$ . Consequently, we have  $\widetilde{F}(x) = F(x)$  for every  $x \in P$ . This completes the proof.  $\Box$ 

**Proof of Proposition [2.1](#page-1-0)**: Let  ${\lbrace \hat{\theta}_x \rbrace}_{x \in P}$  be a family of unitary operators as in Lemma [2.3.](#page-2-1) For  $x \in P$ , denote the set of decomposable vectors in  $E(x)$  by  $D(x)$ . A moment's reflection on the definition shows that the decomposable vectors of  $F(x)$  is  ${\lbrace \widetilde{\theta}_x(T) : T \in D(x) \rbrace}$ . The conclusion is now immediate.

#### 3 A counterexample

In this section, we produce the promised counterexample, i.e. a CCR flow which is asymmetric. Let us recall the definition of a CCR flow associated to a pure isometric representation. Suppose  $V : P \to B(H)$  is a pure isometric representation. Recall that V is said to be pure if  $\bigcap_{x\in P} V_x\mathcal{H} = \{0\}$ . Denote the symmetric Fock space of H by  $\Gamma(\mathcal{H})$ .

The CCR flow associated to V, denoted  $\alpha^V := {\{\alpha_x\}}_{x \in P}$ , is the unique  $E_0$ -semigroup on  $B(\Gamma(\mathcal{H}))$  such that the following equation is satisfied. For  $x \in P$  and  $\xi \in \mathcal{H}$ ,

$$
\alpha_x(W(\xi)) = W(V_x \xi)
$$

<span id="page-4-0"></span>where  $\{W(\xi): \xi \in \mathcal{H}\}\$ is the set of Weyl operators on  $\Gamma(\mathcal{H})$ . For more details regarding multiparameter CCR flows, we refer the reader to [\[1\]](#page-9-5) and [\[2\]](#page-9-6).

Remark 3.1 *A few remarks are in order.*

- *(1) In [\[7\]](#page-9-3), a strongly continuous isometric representation, indexed by* Ω*, is constructed out of a decomposable*  $E_0$ -semigroup (see Proposition 4.1 of  $[7]$ ). Moreover the *resulting isometric representation, up to unitary equivalence, is a cocycle conjugacy invariant.*
- (2) It is shown in [\[7\]](#page-9-3) that the CCR flow  $\alpha^V$  is decomposable. Moreover the isometric *representation constructed out of the decomposable*  $E_0$ -semigroup  $\alpha^V$  is V itself (see *Proposition 5.1 of [\[7\]](#page-9-3)).*

Fix a pure isometric representation V of P on a Hilbert space  $H$ . Denote the CCR flow  $\alpha^V$  by  $\alpha$  and its opposite by  $\alpha^{op}$ . Denote the isometric representation constructed out of  $\alpha^{op}$  by  $V^{op}$ . If we unwrap all the details regarding the construction of  $V^{op}$ , which is routine, we see that  $V^{op}$  has the following explicit description. Denote the Hilbert space on which  $V^{op}$  acts by  $\mathcal{H}^{op}$ .

Define an equivalence relation on  $\{(\xi, a) : \xi \in \text{Ker}(V_a^*), a \in \Omega\}$  as follows. We say  $(\xi, a) \sim (\eta, b)$  if and only if  $V_b \xi = V_a \eta$ . Let  $H^{op}$  be the set of equivalence classes. Then  $H^{op}$  has an inner product space structure where the addition, scalar multiplication and inner product are given by

$$
[(\xi, a)] + [(\eta, b)] = [(V_b \xi + V_a \eta, a + b)]
$$

$$
\lambda[(\xi, a)] = [(\lambda \xi, a)]
$$

$$
\langle [(\xi, a)] | [(\eta, b)] \rangle = \langle V_b \xi | V_a \eta \rangle.
$$

Then  $\mathcal{H}^{op}$  is the completion of  $H^{op}$  and for  $a \in \Omega$ , the operator  $V_a^{op}$  is given by the equation

$$
V_a^{op}[(\xi,b)] = [(\xi,a+b)].
$$

To produce a counter example of a CCR flow which is asymmetric, it suffices to construct a pure isometric representation  $V$  such that  $V$  and  $V^{op}$  are not unitarily equivalent. For if  $\alpha := \alpha^V$  and  $\alpha^{op}$  are cocycle conjugate then by Remark [3.1,](#page-4-0) it follows that  $V$  and  $V^{op}$  are unitarily equivalent.

First we obtain a better description of  $V^{op}$ . Let U be the minimal unitary dilation of V. More precisely, there exists a Hilbert space  $\widetilde{\mathcal{H}}$  containing H as a closed subspace and a strongly continuous unitary representation  $U := \{U_x\}_{x \in \mathbb{R}^d}$  on  $\widetilde{\mathcal{H}}$  such that the following conditions are satisfied.

- (1) For  $a \in \Omega$  and  $\xi \in \mathcal{H}$ ,  $U_a \xi = V_a \xi$ , and
- (2) the increasing union  $\begin{pmatrix} 1 \end{pmatrix}$ a∈Ω  $U_a^*$  *H* is dense in  $\widetilde{\mathcal{H}}$ .

The minimal unitary dilation is unique up to unitary equivalence and the existence of such a dilation is given by an inductive limit procedure.

Set  $\mathcal{K} := \mathcal{H}^{\perp}$ . Since H is invariant under  $\{U_a\}_{a \in \Omega}$ , it follows that K is invariant under  ${U_{-a} : a \in \Omega} = {U_a^* : a \in \Omega}.$  For  $a \in \Omega$ , let  $W_a$  be the operator on K which is the restriction of  $U_{-a}$ . Then  $W := \{W_a\}_{a \in \Omega}$  is a strongly continuous semigroup of isometries on  $K$ .

<span id="page-5-0"></span>Proposition 3.2 *With the foregoing notation, we have the following.*

- *(1) The isometric representation W is pure, i.e.*  $\bigcap$ a∈Ω  $W_a \mathcal{K} = \{0\}.$
- *(2) The isometric representations* W *and* V op *are unitarily equivalent.*

*Proof.* Fix a point  $a \in \Omega$ . Set  $S := V_a$ . Recall the following Archimedean property. Given  $x \in \mathbb{R}^d$ , there exists a positive integer n such that  $na > x$  (see Lemma 3.1 of [\[5\]](#page-9-0)). Thus  $\{0\} = \bigcap$  $b \in \Omega$  $V_b H = \bigcap$  $n \geq 1$  $V_{na} \mathcal{H} = \bigcap$  $n\geq 1$  $S<sup>n</sup>$ H. In other words, S is a pure isometry.

By the Archimedean prinicple, we have the equaltiy  $\bigcup$  $b \in \Omega$  $U_b^* \mathcal{H} = \bigcup$  $n\geq 1$  $U_a^{*n}$ *H*. Hence  $\overline{1}$  $U_a^{*n}$  H is dense in  $\widetilde{\mathcal{H}}$ . In otherwords, the discrete one parameter group of unitaries

 $n\geq 1$  ${U_{na} : n \in \mathbb{Z}}$  is the minimal unitary dilation of the discrete one parameter isometric representation  $\{S^n\}_{n\geq 0}$ .

Using Wold decomposition, we can identify  $\mathcal{H}$  with  $\ell^2(\mathbb{N})\otimes K$  for some Hilbert space K and S with the standard one sided shift with multiplicity. Then  $\widetilde{\mathcal{H}}$  can be identified with  $\ell^2(\mathbb{Z}) \otimes K$  with  $U_a$  identified with the bilateral shift with multiplicity. Once this identification is made, it is clear that  $\bigcap$  $n\geq 0$  $W_{na}K = \bigcap$  $n\geq 0$  $U_a^{*n}$ K = {0}. Once again by the Archimedean principle, we have the equality  $\bigcap$  $b \in \Omega$  $W_b \overline{K} = \bigcap$  $n\geq 0$  $W_{na} \mathcal{K} = \{0\}.$  This proves (1).

Let  $a \in \Omega$ . We claim that the image of the map

$$
Ker(W^*_a) \ni \xi \to U_a \xi \in \widetilde{\mathcal{H}}
$$

is contained in  $Ker(V_a^*)$ . Let  $\xi \in Ker(W_a^*)$  and  $\eta \in \mathcal{K}$  be given. Observe that

$$
\langle U_a \xi | \eta \rangle = \langle \xi | U_a^* \eta \rangle = \langle \xi | W_a \eta \rangle = \langle W_a^* \xi | \eta \rangle = 0.
$$

This proves that for  $\xi \in Ker(W_a^*)$ ,  $U_a \xi \in \mathcal{H}$ . Let  $\xi \in Ker(W_a^*)$  and  $\eta \in \mathcal{H}$  be given. Using the fact that  $\xi \in \mathcal{K}$  and  $\eta \in \mathcal{H}$ , observe that

$$
\langle U_a \xi | V_a \eta \rangle = \langle U_a \xi | U_a \eta \rangle = \langle \xi | \eta \rangle = 0.
$$

Thus  $U_a \xi$  is orthogonal to  $Ran(V_a)$ . Coupled with the fact that  $U_a \xi \in \mathcal{H}$ , we conclude that  $U_a \xi \in Ker(V_a^*)$ . This proves our claim. A calculation similar to the one above implies that the image of the map  $Ker(V_a^*) \ni \eta \to U_{-a} \eta \in \mathcal{H}$  is contained in  $Ker(W_a^*)$ . Consequently the map  $Ker(W_a^*) \ni \xi \to U_a \xi \in Ker(V_a^*)$  is a unitary.

By (1), we have  $\mathcal{K} = \overline{\bigcup_{a \in \Omega} Ker(W_a^*)}$ . Note that the family of inner product preserving maps

$$
\left\{ Ker(W^*_a) \ni \xi \to [(U_a \xi, a)] \in \mathcal{H}^{op} \right\}_{a \in \Omega}
$$

patch together and defines a unitary map from  $\mathcal{K} = \overline{\bigcup_{a \in \Omega} Ker(W_a^*)}$  to  $\mathcal{H}^{op}$ , which we denote by T, such that the following holds. If  $\xi \in Ker(W_a^*)$  for some  $a \in \Omega$  then

$$
T\xi = [(U_a \xi, a)].
$$

It is clear that T intertwines the isometric representations W and  $V^{op}$ . This proves (2). The proof is now complete.  $\Box$ 

Let  $A \subset \mathbb{R}^d$  be such that A is non-empty, proper, closed and  $A + P \subset A$ . Such subsets were called P-modules in [\[2\]](#page-9-6). Consider the Hilbert space  $L^2(A)$ . For  $x \in P$ , let  $V_x$  be the isometry on  $L^2(A)$  defined by the equation

$$
V_x(f)(y) := \begin{cases} f(y-x) & \text{if } y-x \in A, \\ 0 & \text{if } y-x \notin A. \end{cases}
$$
 (3.5)

<span id="page-6-0"></span>Then  $(V_x)_{x \in P}$  is an isometric representation of P which we denote by  $V^A$ . We call  $V^A$ the isometric representation associated to the  $P$ -module  $A$ . Moreover the representation  $V^A$  is pure. In what follows,  $Int(A)$  denotes the interior of A.

Lemma 3.3 *Let* A *be a* P*-module. We have the following.*

- *(1) The increasing union*  $\bigcup_{a \in \Omega} (Int(A) a) = \mathbb{R}^d$ .
- (2) Given a compact subset  $K \subset \mathbb{R}^d$ , there exists  $a \in \Omega$  such that K is contained in  $Int(A) - a.$
- (3) The minimal unitary dilation of  $V^A$  is the left regular representation of  $\mathbb{R}^d$  on  $L^2(\mathbb{R}^d)$ .

*Proof.* Since A is a P-module, it is clear that if  $a < b$  with  $a, b \in \Omega$  then  $Int(A) - a$  is contained in  $Int(A)-b$ . By translating, if necessary, we can assume  $0 \in A$ . Hence  $P \subset A$ and  $\Omega \subset Int(A)$ . Observe the equality  $\mathbb{R}^d = \Omega - \Omega = \begin{bmatrix} 1 \end{bmatrix}$ a∈Ω  $(\Omega - a) \subset \Box$ a∈Ω  $(Int(A) - a).$ 

This proves (1).

Fix an interior point  $a \in \Omega$ . By (1) and by the Archimedean property, it follows that  $(Int(A) - na)_{n \geq 1}$  is an increasing sequence of open sets which increases to  $\mathbb{R}^d$ . Now (2) is immediate.

Let  $\{U_x\}_{x\in\mathbb{R}^d}$  be the left regular representation of  $\mathbb{R}^d$  on  $L^2(\mathbb{R}^d)$ . From the definition it follows that for  $a \in \Omega$ ,  $V_a$  is the compression of  $U_a$  onto  $L^2(A)$ . Observe that for  $a \in \Omega$ ,  $U_a^* L^2(A) = L^2(A - a)$ . It follows from (2) that  $\bigcup U_a^* L^2(A)$  contains the space  $a{\in}\Omega$ of continuous functions with compact support. Consequently  $\bigcup$ a∈Ω  $U_a^* L^2(A)$  is dense in  $L^2(\mathbb{R}^d)$ . Hence  $\{U_x\}_{x\in\mathbb{R}^d}$  has all the properties required to be the minimal minimal unitary dilation of  $V^A$ . This completes the proof.  $\Box$ 

Note that if A is a P-module then  $-(IntA)^c$  is a P-module. Fix a P-module A and let  $V := V^A$  be the isometric representation associated to A. Set  $B := -(Int(A))^c$ .

Proposition 3.4 *Keep the foregoing notation.*

- (1) The isometric representation  $V^{op}$  is unitarily equivalent to the representation  $V^{B}$ .
- *(2) The representations* V *and* V op *are unitarily equivalent if and only if there exists*  $z \in \mathbb{R}^d$  such that  $A = B + z$ .

*Proof.* Thanks to Lemma II.12 of [\[4\]](#page-9-7), A and  $Int(A)$  differ by a set of measure zero. Thus we can identify  $L^2(A)$  with  $L^2(Int(A))$ . Lemma [3.3](#page-6-0) and Proposition [3.2](#page-5-0) implies that  $V^{op}$  is equivalent to the isometric representation  $W = \{W_a\}_{a \in \Omega}$  acting on the Hilbert space  $L^2((Int(A))^c)$  where the operators  $\{W_a\}_{a\in\Omega}$  are given by the following equation. For  $a \in \Omega$  and  $f \in L^2((Int(A))^c)$ 

$$
W_a(f)(y) := \begin{cases} f(y+a) & \text{if } y+a \in (Int(A))^c, \\ 0 & \text{if } y+a \notin (Int(A))^c. \end{cases}
$$
(3.6)

The inversion  $\mathbb{R}^d$   $\ni$   $x \to -x \in \mathbb{R}^d$  induces a unitary between the Hilbert spaces  $L^2((Int(A))^c)$  and  $L^2(B)$  and intertwines the representations W and  $V^B$ . This proves (1).

It is clear that if A is a translate of B then  $V = V^A$  and  $V^{op} = V^B$  are unitarily equivalent. On the other hand, suppose  $V^A$  and  $V^B$  are unitarily equivalent. Then the associated CCR flows  $\alpha^{V^A}$  and  $\alpha^{V^B}$  are cocycle conjugate. By Theorem 1.2 of [\[2\]](#page-9-6), it follows that A and B are translates of each other.<sup>[1](#page-8-0)</sup> This completes the proof.  $\Box$ 

Thus to produce a counterexample of a CCR flow which is not cocycle conjugate to its opposite, it suffices to produce a P-module A such that A is not a translate of  $-(Int(A))^c$ . The cone P itself is one such candidate. Recall that we have assumed  $d \geq 2$ . Let us recall the notion of extreme points. For a subset C of  $\mathbb{R}^d$  and a point  $x \in C$ , we say x is an extreme point of C if  $x = \frac{y+z}{2}$  with  $y, z \in C$  then  $y = z = x$ .

#### **Lemma 3.5** *The sets*  $P$  *and*  $-\Omega^c$  *are not translates of each other.*

*Proof.* First we claim that  $P \cup -P \neq \mathbb{R}^d$ . Suppose not. Since we have assumed that  $P \cap -P = \{0\}$ , it follows that the only boundary point of P is  $\{0\}$ . Fix  $a \in \Omega$ . Proposition 2.3 of [\[2\]](#page-9-6) implies that the map

$$
\partial(P) \times (0, \infty) \ni (x, s) \to x + sa \in \Omega
$$

is a homeomorphism. But  $\partial(P) = \{0\}$  and hence  $\Omega = \{sa : s > 0\}$ . Since  $\Omega$  spans  $\mathbb{R}^d$ , it follows that  $d = 1$  contradicting our assumption. Therefore  $P \cup -P \neq \mathbb{R}^d$ .

Note that the set of extreme points of P is  $\{0\}$ . For we have assumed that P contains no line. On the other hand, we claim that  $\Omega^c$  has no extreme point. Note that  $t\Omega^c \subset \Omega^c$ for  $t > 0$ . Hence the set of extreme points of  $\Omega^c$  is contained in  $\{0\}$ . But 0 is not an extreme point of  $\Omega^c$ . To see this, pick  $x \notin P \cup -P$ . Then  $x \in \Omega^c$ ,  $-x \in \Omega^c$  and  $x \neq 0$ . But  $0 = \frac{x + (-x)}{2}$ . This proves that the set of extreme points of  $\Omega^c$  is empty. Consequently, the set of extreme points of any translate of  $-\Omega^c$  is empty. Hence P and  $-\Omega^c$  are not translates of each other. This completes the proof.  $\Box$ .

<span id="page-8-0"></span><sup>&</sup>lt;sup>1</sup>See also Page 26 of [\[7\]](#page-9-3).

**Remark 3.6** Let V be a pure isometric representation of P and  $\alpha = \alpha^V$  be the associated CCR flow. Let  $V^{op}$  be the isometric representation corresponding to the decom*posable*  $E_0$ -semigroup  $\alpha^{op}$ . Since  $\alpha$  is spatial, it follows that  $\alpha^{op}$  is spatial. (Recall that an  $E_0$ -semigroup is said to be spatial if its product system admits a nowhere vanishing *multiplicative measurable cross section). By Theorem 4.4 of* [\[7\]](#page-9-3), it follows that  $\alpha^{op}$  and  $\alpha^{V^{op}}$  are cocycle conjugate. Thus, to summarise, an opposite of a CCR flow is a CCR *flow but not necessarily the same as the original one.*
