I. SUPPLEMENTAL MATERIALS

This supplement includes the double and single differential cross sections used in this analysis. The bin limits used for all cross sections are presented in Table I. Double differential cross sections are given in section IA, and single differential cross sections are shown in IB.

Bin	$p_{ }$	p_T
1	[1.5, 2.0)	[0.000, 0.075)
2	[2.0, 2.5)	[0.075, 0.150)
3	[2.5, 3.0)	[0.150, 0.250)
4	[3.0, 3.5)	[0.250, 0.325)
5	[3.5, 4.0)	[0.325, 0.400)
6	[4.0, 4.5)	[0.400, 0.475)
7	[4.5, 5.0)	[0.475, 0.550)
8	[5.0, 6.0)	[0.550, 0.700)
9	[6.0, 8.0)	[0.700, 0.850)
10	[8.0, 10.0)	[0.850, 1.000)
11	[10.0, 15.0)	[1.000, 1.250)
12	[15.0, 20.0)	[1.250, 1.500)

A. Double Differential Cross Sections

The measured double differential cross section is shown in Table II, with the total uncertainties Table III. Tables IV-XIII show the Monte Carlo cross sections for each model and variant used.

TABLE XIII. Monte Carlo predicted double differential cross section as a function of $p_{||}$ (columns) and p_T (rows) in units of cm^2 per GeV^2 per nucleon. This prediction is for GiBUU 2019.

B. Single Differential Cross Sections

The measured single differential cross section in longitudinal momentum is shown in Table XIV, and in transverse momentum in Table XV. The remainder of the tables show the Monte Carlo single differential cross sections in both longitudinal and transverse momentum.

Bin	Cross Section	Stat. Unc.	Total Unc.

TABLE XXXV. Monte Carlo predicted differential cross section as a function of p_T in units of cm^2 per GeV per nucleon. This prediction is for GIBUU 2019.

C. Q^2 and W Distributions

The average four momentum transfer squared, Q^2 , in each bin for CC events in GENIE 2.8.4 is shown in Fig. 1, defined as $Q^2 = 2E_\nu(E_\mu - p_\mu \cos(\theta_\mu)) - m_\mu^2$. Here E_μ and p_μ are the energy and momentum of the muon respectively, E_ν is neutrino energy, θ_μ is the muon angle with respect to the beamline, and m_μ is the muon mass. The average invariant mass, W , per bin for GENIE 2.8.4 is shown in Fig. 2, where $W = \sqrt{m_N^2 + 2(E_\nu - E_\mu) - Q^2}$ and m_N is the mass of the nucleon. Standard deviations are shown as the error bands in both figures. The true DIS thresholds, at $Q^2 = 1 \text{ GeV}^2$ and $W = 2 \text{ GeV}$, are marked by dashed lines in the respective figures.

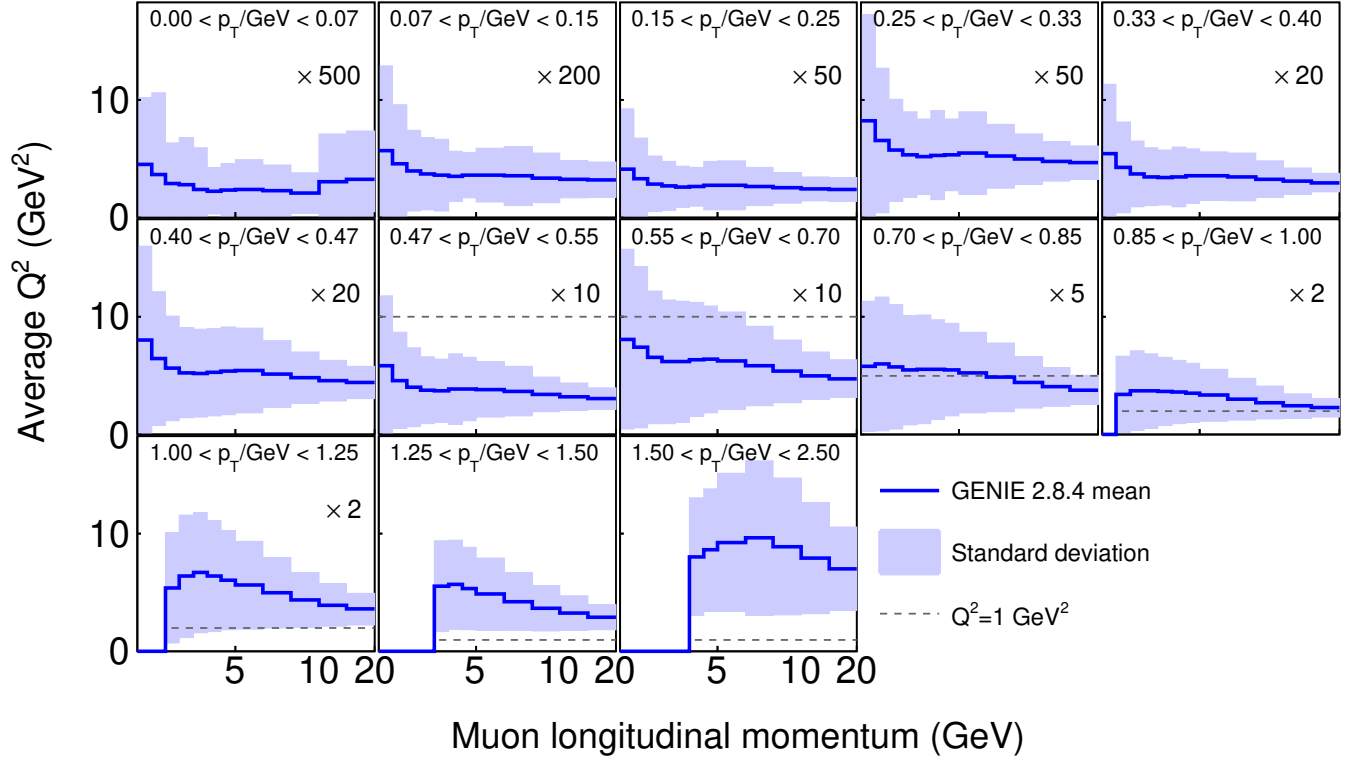

FIG. 1. Average Q^2 of CC interactions for each bin used in this analysis for GENIE 2.8.4, with the standard deviation shown as the error band.

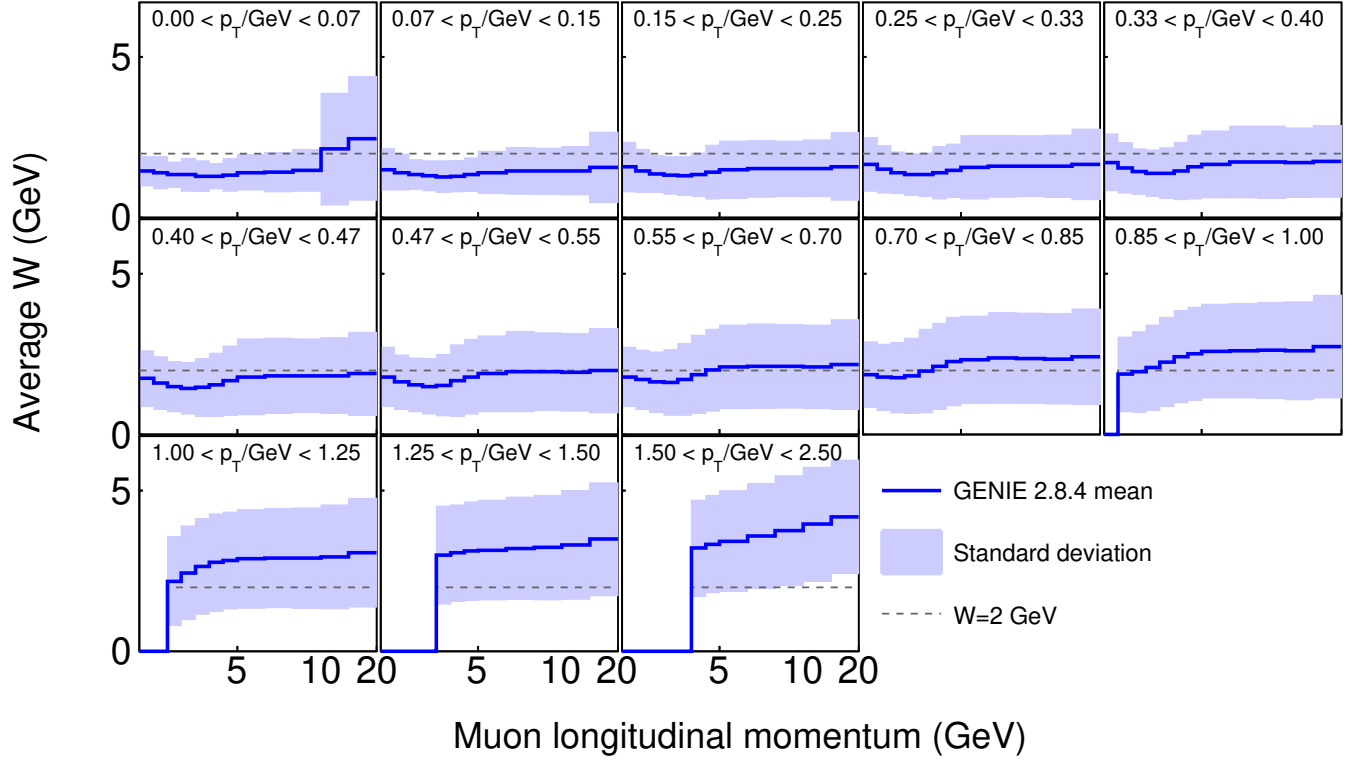

FIG. 2. Average W of CC interactions for each bin used in this analysis for GENIE 2.8.4, with the standard deviation shown as the error band.
