

Example: $V_s G_s F_t$

```
for (int v=0; v<V; v+=T_V)
  for (int g=0; g<G; g+=T_G)
    for (int f=0; f<F; f+=T_F)
```

Loop order - VGF ($V \rightarrow G \rightarrow F$)

```
parfor (int v1=0; v1<T_V V; v1++) //parallel loop
  parfor (int g1=0; g1<T_G G; g1++) //parallel loop
    parfor (int f1=0; f1<T_F F; f1++) //parallel loop
```

```
X1[v+v1][g+g1] += I[v+v1][f+f1] * W[f+f1][g+g1];
```

Tile size determines spatial or temporal.

$s \Rightarrow \text{Spatial} \Rightarrow T_Dim > 1$ and

$t \Rightarrow \text{Temporal} \Rightarrow T_Dim = 1$

Example: $T_V=4, T_G=4, T_F=1$

V and G have spatial parallelism (s) and F is temporal (t)
