

question

environment

LM

*induced function*

```
def calc_rate_of_change(  
    df, value_column, time_column, time1, time2):  
    “Calculate the rate of change in values”  
    row1 = df[df[time_column] == time1  
    row2 = df[df[time_column] == time2  
    value1 = row1[value_column].values[0]  
    value2 = row2[value_column].values[0]  
    return (value2 - value1) / (time2 - time1)
```

&

*generated solution*

```
calc_rate_of_change(df, “Vacation days”, “Year”,  
2015, 2016)
```
